

Risk	Control	Purpose
Lack of Multi-Factor Authentication (MFA)	Enforce MFA across all systems	Prevents unauthorized access even if passwords are stolen
Unpatched Software Vulnerabilities	Automated patch management program	Reduces exposure to known security vulnerabilities
Misconfigured Cloud Storage	Secure-by-default cloud configuration policies	Prevents accidental public exposure of sensitive data
Excessive User Access (Over-Permissioning)	Role-based access control (RBAC) with least privilege	Limits user access to reduce misuse or insider risk
Inadequate Data Backups	Automated backups with regular recovery testing	Ensures data can be restored after ransomware or system failure
